

The themes, in full

Or your own idea: any service people are paid to do, on data about people and companies.

Theme

Hiring

The job today

Recruiters and staffing agencies are paid when someone starts work, not for a list of names. The person who fits rarely applies, often goes by another title, and changed jobs weeks before their profile says so.

Build

Build an agent that fills roles with no one at the keyboard:

- Take a three-line brief to a signed offer, while keeping a hundred conversations alive for weeks.
- Prove or disprove every claim on a candidate's record.
- Staff a thousand shifts from applications seeded with fakes.

We're looking for agents that, tested on last year's real job openings, find the people who were actually hired.

Theme

Investing

The job today

Venture funds and banks pay analysts to find companies, check them, track them and price them. Every call is made on what is known that day, and whether it was right shows only years later.

Build

Build an agent that makes a fund’s calls on its own:

- Back founders before their first round.
- Find what a startup’s data room hides.
- See a portfolio company running out of cash before its founder says so.
- Rebuild a fund manager’s real returns, deal by deal.
- Run a company’s sale against buyers who bluff.
- Price an IPO from its 400-page offer document.

We’re looking for calls that hold up when tested on past dates, using only what was known on each date.

Theme

Research and markets

The job today

Analysts at banks, funds and research labs read, forecast and decide what to test next. There is more to read than any person or model can hold at once, and a model trained on old news already knows how past quarters ended.

Build

Build an agent that gets to the answer before the market does:

- Answer any question about a company in an industry it has never seen, from thousands of pages, with the page behind every number.
- Forecast a company's next quarter before it reports, and trade on it.
- Spend a lab's fixed budget on the experiments most likely to find something new.

We're looking for results scored on real numbers published after every model you use was trained.

Theme

Insurance

The job today

Underwriters, brokers and claims adjusters work out what a business really does, what it needs to be covered for and what a claim is worth, mostly from what the customer chooses to tell them.

Build

Build an agent that insures a business with no one in the loop:

- Check an insurance application against what outside data says about the business.
- Find the risks its 40-page policy leaves uncovered, and get quotes to fix them.
- Settle a damage claim from photos that may be edited, reused or lifted from the web.

We're looking for decisions that cite their reasons and stay the same however the case is worded.

Theme

Trust and compliance

The job today

Compliance teams, credit analysts, auditors and fraud investigators decide who is real, who is safe and who is lying. The evidence is spread across government registries, scanned annual reports and the files of other lenders, which they may not see.

Build

Build an agent that decides who to trust:

- Tell a trading business from a shell whose papers are all genuine.
- Set a credit limit from annual reports in any language.
- Flag the filing a company will later have to correct.
- Separate a fraud ring from companies that simply share an office.
- Let lenders warn each other about fraud without revealing a single customer.

We’re looking for every fake caught and no honest business turned away.

Theme

Buying and paying

The job today

Procurement and payables teams decide which supplier gets an order and which invoice gets paid, and they are the last check before money leaves the company.

Build

Build an agent you can hand the company's books:

- Turn a vague purchase request into a supplier choice an auditor would sign off on.
- Pay every invoice exactly once, even if the payment run crashes halfway.

We're looking for zero payments made in error.

Theme

Agents that spend

The job today

People and companies want agents that pay for what a task needs, from a laptop or a software plan to a dataset or an hour of compute. Today the choice is a person approving every payment, or an agent trusted with an open card.

Build

Build an agent that spends on someone's behalf with no one watching:

- Buy exactly what a person asked for, from shops it has never seen.
- Sign a team up for the tools a project needs, and keep the bill right for months.
- Keep a dozen agents inside one shared budget while sellers try to talk them past it.

We're looking for jobs finished end to end, with every rupee inside limits the owner can read, change and take back at any moment.

Theme

Supply chain

The job today

Freight forwarders and hardware buyers move goods and parts across borders between a dozen companies that share no system, mostly by email, spreadsheet and supplier portal.

Build

Build an agent that runs those operations end to end:

- Take hundreds of shipments from price quote to paid invoice, while updates arrive late, out of order or twice.
- Land every part on a satellite’s bill of materials, genuine and on time.
- Do a clerk’s whole morning inside a website that has no API.

We’re looking for operations where every record, document and cost agrees at any moment.

Theme

Revenue

The job today

Sales, marketing, strategy and fundraising teams win by reaching the right person at the right moment, and both change every week.

Build

Build an agent that brings in revenue on its own:

- Reach the person who decides, the week their company starts looking to buy.
- Answer and route every inbound lead within a minute, without inventing a claim.
- Forecast a rival’s next launch from who it is hiring.
- Decide which of tens of thousands of alumni to ask for a gift, when and for how much.

We’re looking for meetings booked, gifts given and forecasts that come true, more of them every run.

Theme

Infrastructure for agents

The job today

Every agent in the other themes needs the same building blocks, and most of them don’t exist yet.

Build

Build one of them:

- Memory that carries hundreds of cases for months.
- A company’s rules and know-how, turned into checks agents run and cite.
- CRM, billing and support systems that keep their records in agreement on their own.
- A map of who knows whom, scored by how closely they worked.
- Proof of who sent a message, and on whose authority an agent acts.
- A check that stops a wrong email before it is sent.
- A tamper-proof record of where every fact came from.
- An exam built from facts no model has seen.

We’re looking for building blocks that still hold after a crash, a model swap or a lie.
